

Smart Traceability Solutions

Our Vision

To deliver a step-change in UK recycling and asset tracking business effectiveness by integrating state of the art technologies from leading industrial and academic organisations into recycling and asset tracking processes.

Data and User Interface	7

Smart Technology for the Internet of Things

Developing On-demand Intelligent Systems
and Services for Recycling, Returns and
Asset Tracking

- ▶ Reusable intelligent systems
- ▶ Increased business and processes efficiency
- ▶ Reduced complexity in recycling systems
- ▶ Agile scheduling
- ▶ Cross supply-chain collaboration

Electronic Components Recycling

Monitoring the Recycling of Assets, Materials and Components at S2S

Our recycling solution monitors assets and processes from receipt of equipment by a reuse organisation up to sale or donation.

RFID enabled workbenches track tagged items. Web services then provide real-time information on goods as they pass through stations such as visual inspection, data erasure, functional testing and PAT testing:

- ▶ Traceability of assets
- ▶ Assurances that process order is maintained
- ▶ Cost analysis support for repair and resale of assets

PAS141 Compliance

Improve customer confidence,
resale value and your business reputation

The RFID tracking system meets all the requirements of the PAS141 standard. The system also provides useful data and therefore knowledge about your business operation informing and improving decision making

- ▶ Each item is uniquely recognised
- ▶ Each process for the preparation of reuse is monitored
- ▶ Data are stored for each process
- ▶ Tracking report is generated
- ▶ System Rules ensure correct process order is adhered to

Improved Auditing

Track items from collection to sale

ADISA standards

Trakk-it tracking system can be used to track items from collection throughout processing and on to re-sale, recycle or scrap

Consignment and Invoice

All items are recorded both individually and against their original consignment ID an on to final invoice making auditing simpler

Traceability each item has an individually recorded history including consignment, testing, timing, value and processing

How the System Works

Tracking assets through your business

- ▶ **RFID Tags** remain attached throughout processing for **full traceability**

- ▶ **Reusable Fobs**
Bespoke tag attachment is **non-invasive** and simply removed making RFID tags reusable

- ▶ **RFID Readers** installed at work stations processing and product data are recorded to the RFID system database. Mobile reader is in development

- ▶ **Item Identification**
RFID tag links item with IMIE number or serial number logged for future recall

- ▶ **Database**
Recorded data are input and accessed via a secure web based interface

Advantages of the RFID System

Tracking items from collection to sale

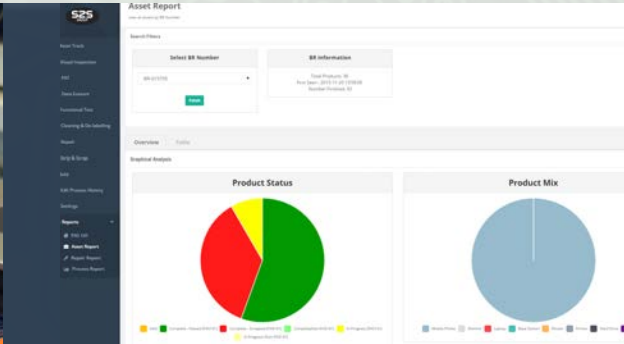

Future proof your business by progressing towards the Internet of Things, and **SMART** recycling systems.

- ▶ **Convenience**
accessed via a web interface on any device capable of loading a web browser
- ▶ **Cross Platform Compatibility**
HTML and JavaScript ensure the system provides a cross platform interface for data entry and retrieval
- ▶ **Low Cost Solution**
minimal installation and infrastructure required to set up
- ▶ Unlike barcodes, RFID tags are not affected by the dirt and dust typical of a warehouse and remain **Readable** throughout handling
- ▶ **PAS141** compliance and **Auditing** improvements

Data and User Interface

Reconfigurable, Scalable and Extendable System

HTML and JavaScript for cross platform compatibility

Data are stored in the system database which is extendable and reconfigurable depending on your requirements and processes.

The data are input and accessed via a web based responsive interface.

Fast deployment and ease of use

- ▶ **Reconfigurable**
Using route cards and an editable database structure allows acquisition of new data from the tracking system with minimal adjustment
- ▶ **Responsive Web Design** optimises user view across devices of varying screen size
- ▶ **Familiarity** of most users with web based interface minimises training and stress for employees, and maximises adoption of the system

Data

Product Type
Process History
Processing Time
Value
Sales, Scrap, Sold
Consignment Progress
